OBJECTIVE

Junior student in Electrical and Electronic Engineering at Yonsei University, with project experience in decision-making, imitation learning. I am interested in reinforcement learning and decision-making problems.

EDUCATION

- **Yonsei University** Mar 2026 - Present
B.S. in Electrical and Electronic Engineering Seoul, South Korea
 - **Relevant Coursework:** Probability and Random Variables
- **Soongsil University** Mar 2020 - Dec 2025
Undergraduate Studies in Artificial Intelligence Seoul, South Korea
 - GPA: 4.1 / 4.5
 - **Relevant Coursework:** Autonomous Driving Programming, Machine Learning, Linear Algebra, Data Structures
 - Academic Excellence Scholarship (Fall 2023 - Spring 2025)

EXPERIENCE

- **NAVER Cloud** Jun 2024 - Feb 2025
Intern Seongnam, South Korea
 - Developed a financial decision-support agent that mimics analyst-style workflows across financial statements, disclosures, market data, and expert reports.
 - Built a planner-based tool orchestration pipeline for query decomposition, financial retrieval, calculation, and grounded answer generation in high-stakes financial Q&A.

PROJECTS

- **Kaggle Orbit Wars** May 2026 - Jun 2026
Tools: Python, PyTorch [Website](#)
 - Built a structured planning agent for Kaggle Orbit Wars, combining future-state simulation, target scoring, safe fleet allocation, and defensive regrouping heuristics.
 - Applied behavioral cloning and PPO-based self-play to study reinforcement learning methods using a single RTX 3060 Ti GPU.
- **ACT-based Robot Manipulation on SO-ARM101** Apr 2026 - Jun 2026
Tools: PyTorch [Website](#)
 - Built an imitation learning pipeline for fruit-object pick-and-place tasks using the SO-ARM101 robot arm.
 - Collected real-world demonstrations through leader-follower teleoperation and trained an ACT-based policy for physical robot manipulation.
- **F1TENTH Autonomous Racing Simulation** Mar 2025 - Jun 2025
Tools: ROS2, Python, C++, Linux [Website](#)
 - Implemented [TinyLidarNet](#) and integrated it into a ROS2-based F1TENTH simulation pipeline for LiDAR-only end-to-end driving.
 - Built a ROS2 inference pipeline that converted 1D LiDAR scans into steering and speed commands in simulation.

HONORS AND AWARDS

- **2nd Place, SCON Campus Programming Contest** May 2024
Soongsil University
- **3rd Place, SCON Campus Programming Contest** May 2023
Soongsil University

EXTRACURRICULAR ACTIVITIES

- **Roboin, Yonsei University** Apr 2026 - Present
Robotics Club
 - Work with club members on robotics projects involving hardware setup, control, and robot learning applications.

SKILLS

- **Programming:** Python, C/C++, PyTorch, Git, Linux, ROS2
